# Correlated Color Temperature

Correlated Color Temperature (CCT) is a less precise measurement of the color of white. The target is 6505. Higher than 6505 is too blue. Lower is too red.

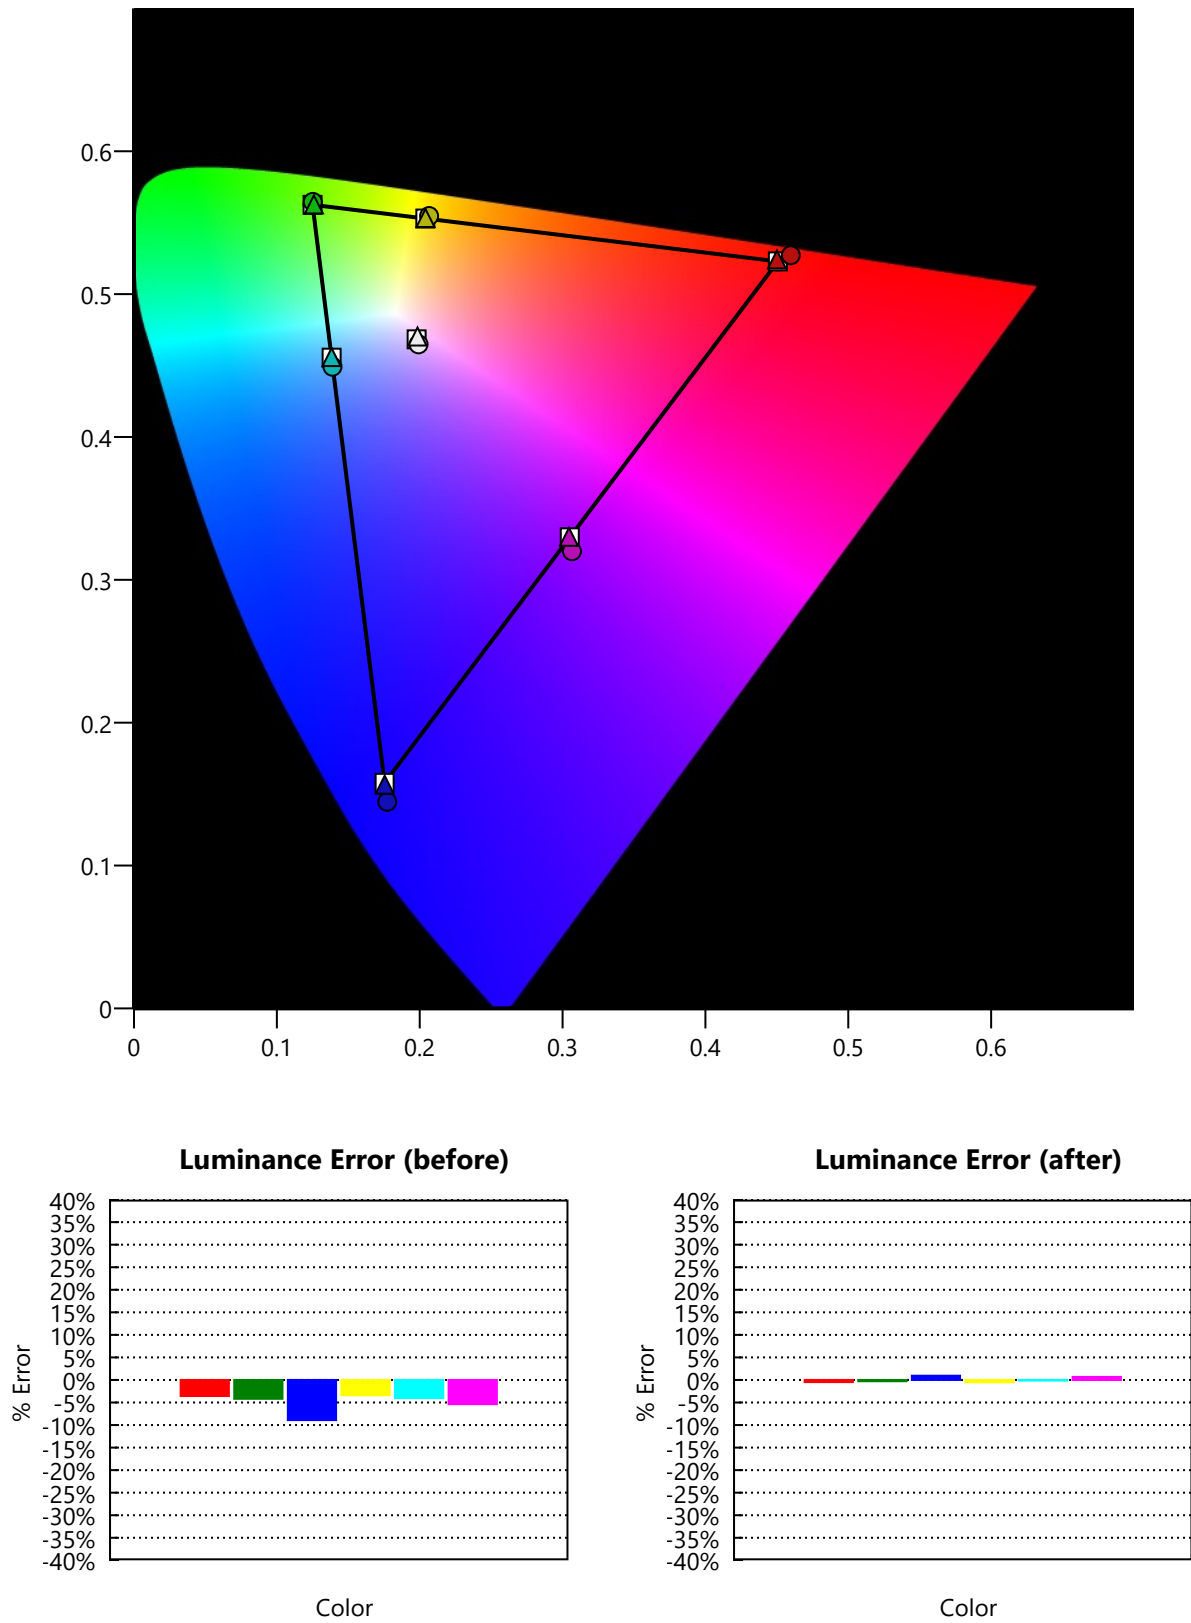

# CIE Charts

These charts graphically map the accuracy of the display's color saturation and hue relative to the chosen standard. The closer the 'After' symbols are to the reference points, the more accurate the color. There are 2 chromaticity charts, one showing before/after performance based on the 1931 xy system and another based on the 1976 u'v' system, which is less well known, but more perceptually uniform.

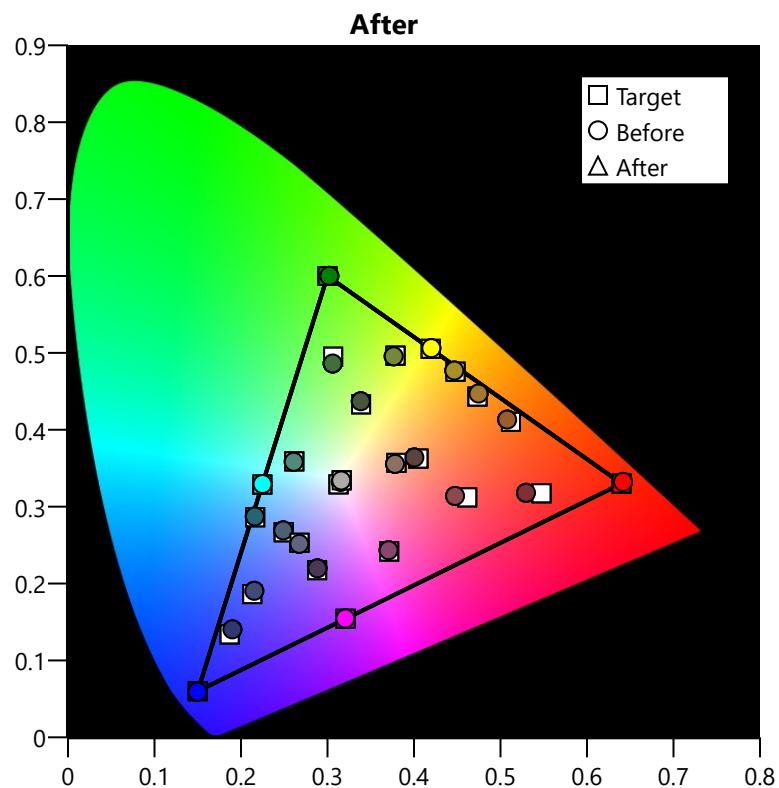

CIE 1976

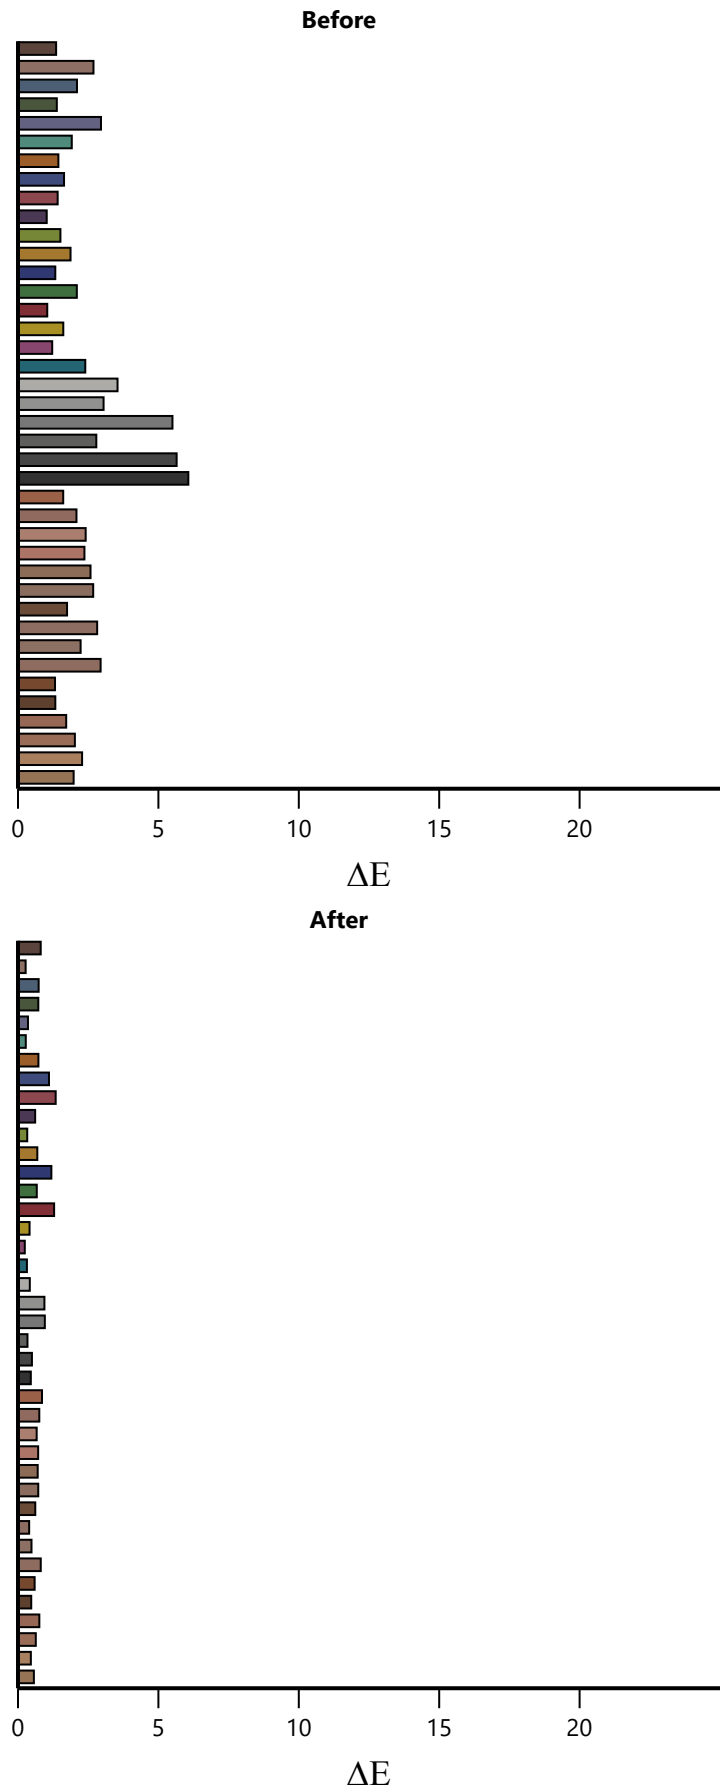

## ColorChecker

The ColorChecker evaluates the real-world color performance of the display by measuring the accuracy of ordinary colors found in the natural world. It includes 24 natural colors plus 16 extra colors that sample a variety of human skin tones. These are important because human vision is especially sensitive to inaccurate skin tone reproduction.

## Gamma

Gamma describes the rate at which video output increases with signal input. This is not a one-to-one relationship. If gamma is too high, the image will darken and shadow detail will suffer. If gamma is too low, contrast and depth suffer.

## Grayscale $\Delta E$ Chart

This chart displays the color of white across the entire grayscale in raw xy data and Delta-E. White is defined as x0.3127, y0.3290. Delta E (dE or  $\Delta E$ ) measures deviation from a color standard. The smaller the number, the less the deviation from the standard and the more accurate the color. Ideally,  $\Delta E$  for white should not rise above 2.
